

Embedded Linux[®] Hands-on Tutorial for the ZYBO[™]

Revised December 5, 2014

Overview

The purpose of this document is to provide step-by-step instructions for customizing your hardware, compiling the Linux Kernel, and writing driver and user applications. This documentation intends to integrate knowledge and skills in FPGA logic circuit design, standalone software programming, Linux operating system and user application development, and apply them to the ZYBO. We will start from the *ZYBO Base System Design* (available on the ZYBO product page of the Digilent website). The system architecture for the *ZYBO Base System Design* is shown in Fig. 1.

In the *ZYBO Base System Design*, we connect UART1 to USB-UART, SD0 to the SD Card Slot, USB0 to the USB-OTG port, Enet0 to the Giga-bit Ethernet Port, and Quad SPI to the on-board QSPI Flash. These cores are hard IPs inside the Processing System (PS) and connect to on-board peripherals via Multiplexed I/O (MIO) pins. The use of PS GPIO is connected to Btn 4 and 5. In the Programmable Logic (PL), we have an HDMI TX Controller, VDMA, and GPIO IP cores to talk to the ADV7511 HDMI transmitter chip and I2S and GPIO IP cores for ADAU1761 audio codec. More details of the hardware design can be found in the documentation inside the *ZYBO Base System Design* package.

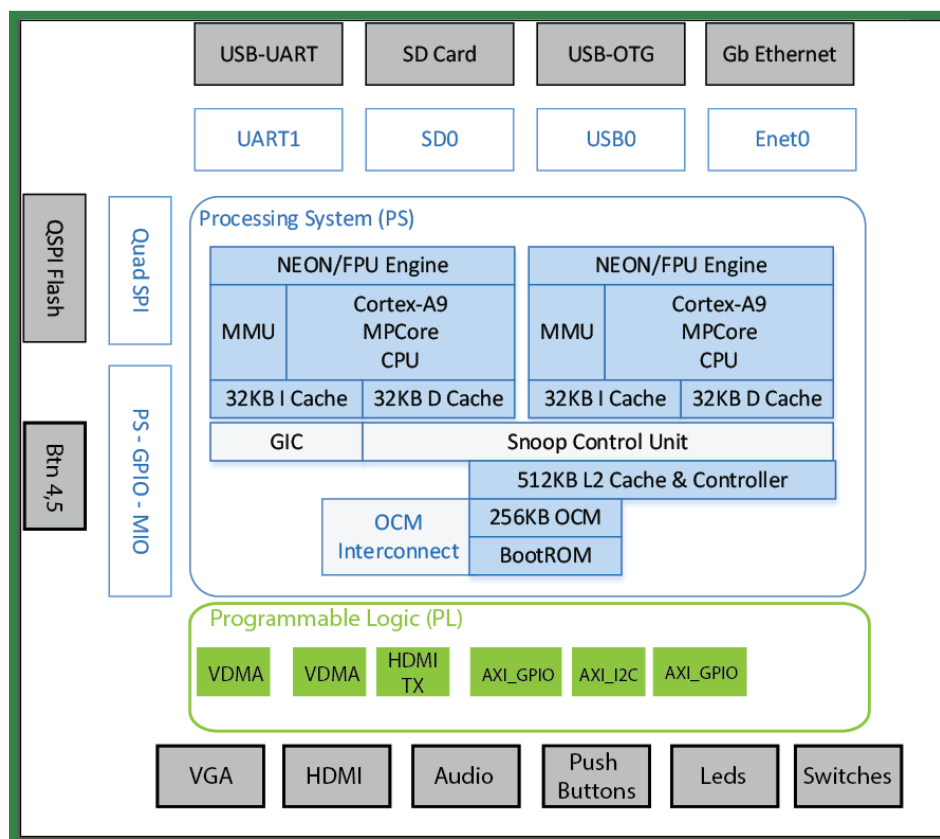

Figure 1. Reference Basic Hardware System Architecture for ZYBO.

In this tutorial, we are going to detach the LEDs from the AXI GPIO core and implement our own `myLed` core for it in PL, as shown in Fig. 2. We will then add our own LED controller into the device tree, write a driver for it, and develop user applications to control the status of the LEDs.

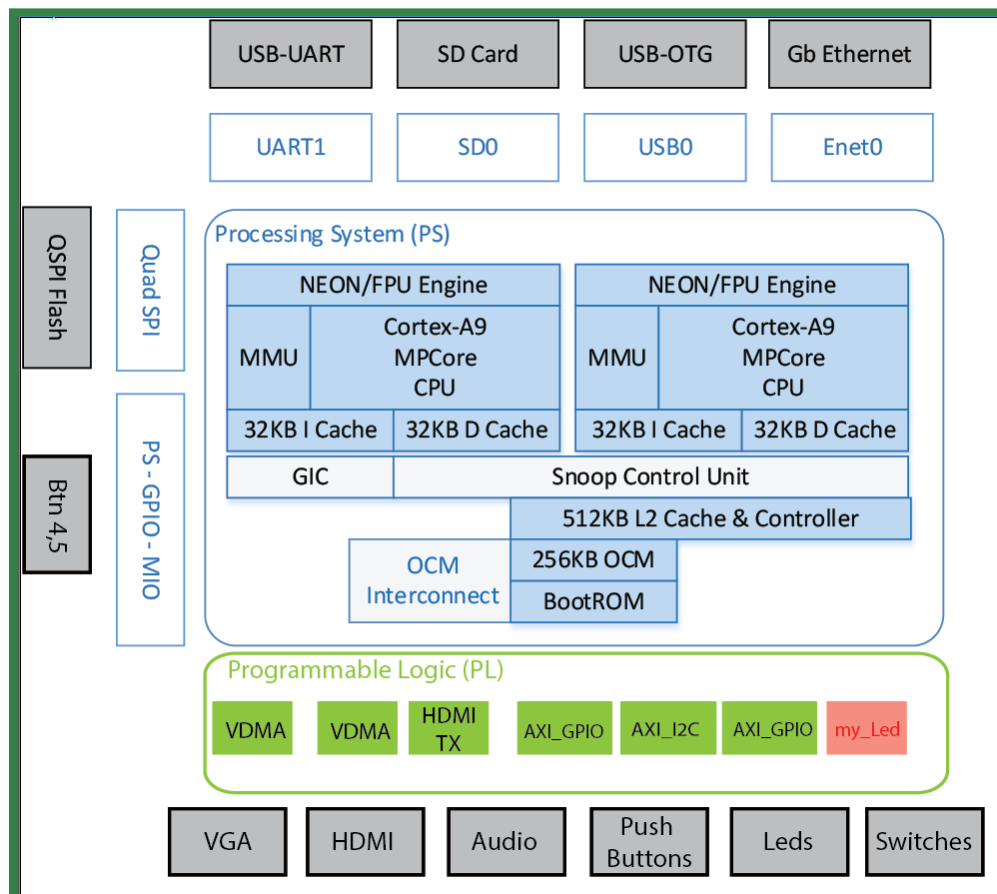

Figure 2. Hardware System Architecture of the system we are going to implement in this Tutorial.

Before going through this tutorial, we recommend that you read *Getting Started with Embedded Linux - ZYBO*. You can follow this tutorial with the *Embedded Linux Development Guide* (available on the Digilent website Embedded Linux Page). The guide will provide you with the knowledge you may need in each step of the development.

In this tutorial, we are going to use Xilinx® Vivado™ 2014.1 WebPACK™ in a Linux environment. All of the screenshots and codes are done using Vivado Design Suite 2014.1 in CentOS 6 x86_64.

That's it for the background information on this tutorial, now it's time to get our hands dirty with some real design!

1 Hardware Customization

1.1 Prerequisites

- Vivado 2014.1 WebPACK: available at the Xilinx website [Download Page](#).
- *ZYBO Base System Design*: available at the Digilent website on the [ZYBO Page](#).

1.2 Instructions

1. Download the *ZYBO Base System Design* from the Digilent website and unzip it into our working directory, as in Fig. 3 (our working directory is named **tutorial** throughout this document). For more information on the hardware design, please refer to *Project Guide* under doc folder.

```
[kfranz@localhost Tutorial]$ unzip /home/kfranz/Downloads/zybo_base_system.zip
Archive:  /home/kfranz/Downloads/zybo_base_system.zip
  inflating: zybo_base_system/ProjectGuide.txt
   creating: zybo_base_system/sd_image/
  inflating: zybo_base_system/sd_image/B00T.bin
   creating: zybo_base_system/source/
   creating: zybo_base_system/source/ise/
   creating: zybo_base_system/source/ise/hw/
   creating: zybo_base_system/source/ise/hw/data/
  inflating: zybo_base_system/source/ise/hw/data/ps7_constraints.ucf
```

Figure 3. Unzip the ZYBO_Base_System.

2. Source Vivado 2014.1 settings and open the design with Vivado Design Suite. You will see the Vivado window pop up as shown in Fig. 4.

Note: There are four settings files available in the Vivado toolset: settings64.sh for use on 64-bit machines with bash; settings32.sh for use on 32-bit machines with bash; settings32.csh for use on 32-bit machines with C Shell; and settings64.csh for use on 64-bit machines with C Shell.

```
[kfranz@localhost Tutorial]$ source /opt/Xilinx/Vivado/2014.1/settings64.sh
[kfranz@localhost Tutorial]$ vivado zybo_base_system/source/vivado/hw/zybo_bsd/z
ybo_bsd.xpr

***** Vivado v2014.1 (64-bit)
***** SW Build 881834 on Fri Apr  4 14:00:25 MDT 2014
***** IP Build 877625 on Fri Mar 28 16:29:15 MDT 2014
** Copyright 1986-2014 Xilinx, Inc. All Rights Reserved.

start_gui
```

Figure 4. Open the Project.

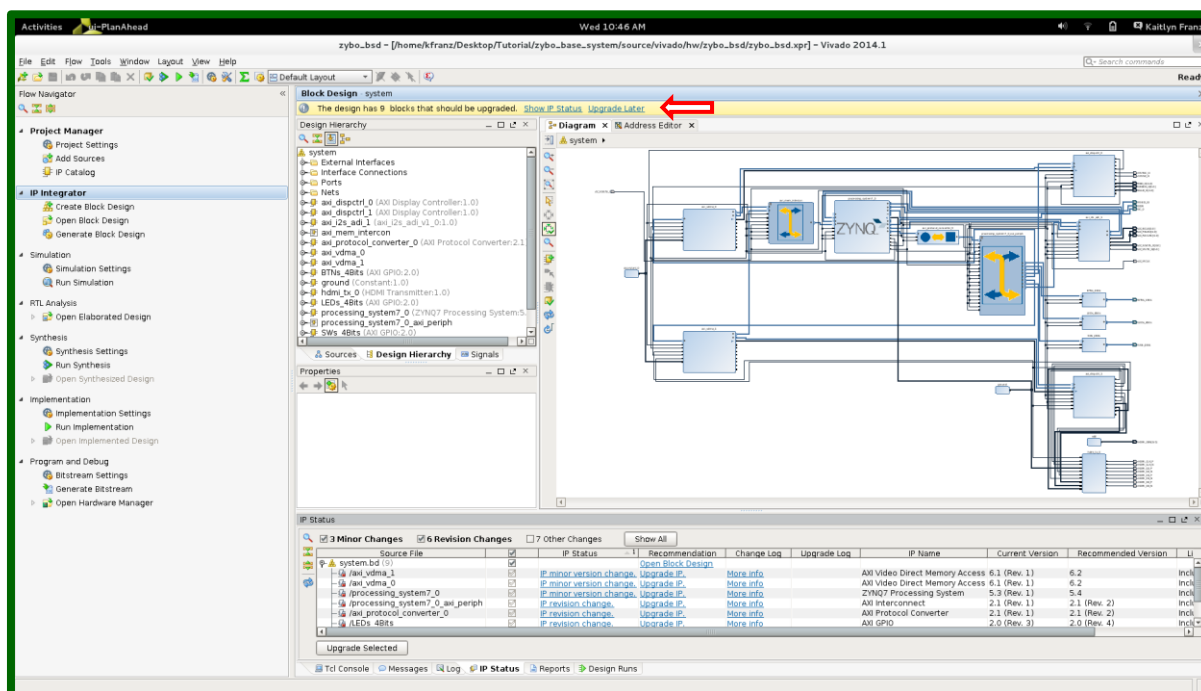

Figure 5. Vivado platform studio GUI.

- We are going to detach LEDs from the GPIO core in the PS first. So we need to click on the IP integrator and open the **Block Diagram** as shown in Fig. 5. Then we need to delete the current LED IP as shown in Fig. 6. We will handle the modification of external pin location configuration (**xdc** file) in later steps.

Note: In Fig. 6 there is a yellow bar indicating the need for an upgrade. To upgrade, hit **show IP status**, make sure all are selected and hit **Upgrade Selected**.

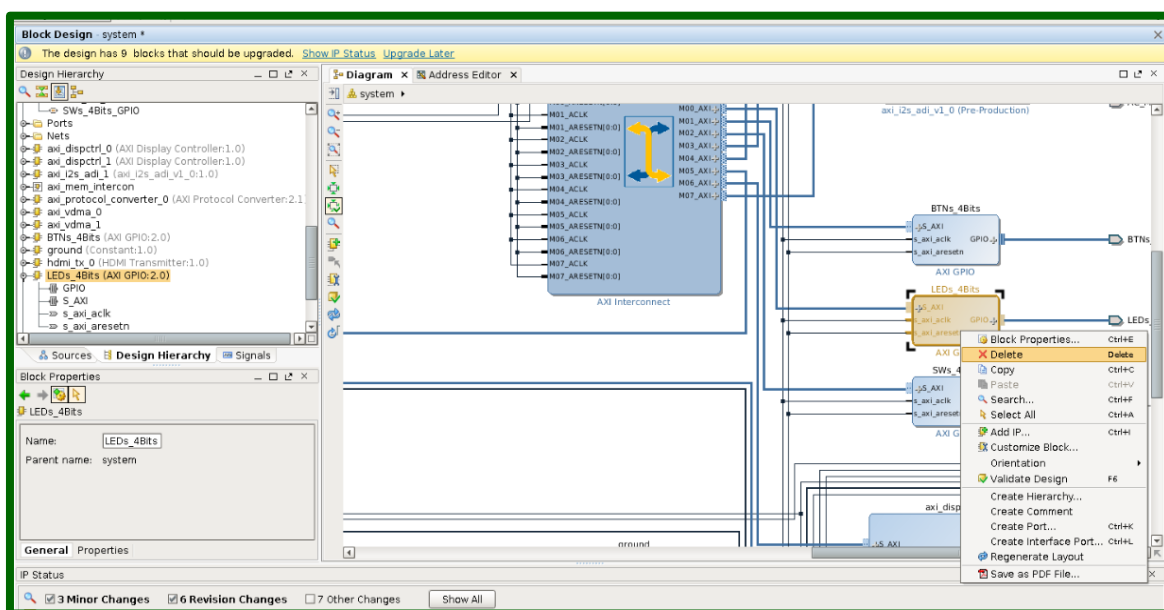

Figure 6. Delete existing LED IP.

4. (Vivado 2014.1 only) Before we can start implementing our myLed IP Core, we need to name the vendor that will automatically be applied in the IP packager. In Vivado 2014.1, this is not automatically done for the user. To do this, first go to the **Project Settings** under **Project Manager** on the left side of the window (Fig. 7) and the project settings window will pop up. In the Project Settings window, select **IP** (Fig. 8). Notice that the vendor is chosen as “(none)”, this will cause a Vivado internal exception. You can name the Vendor whatever you like (Fig. 9).

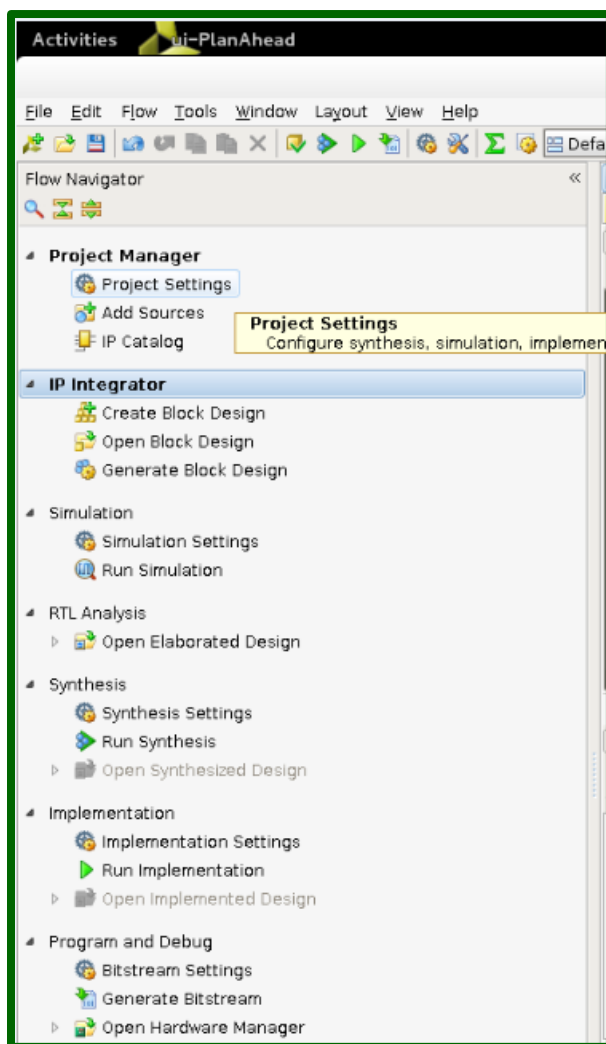

Figure 7. Project settings.

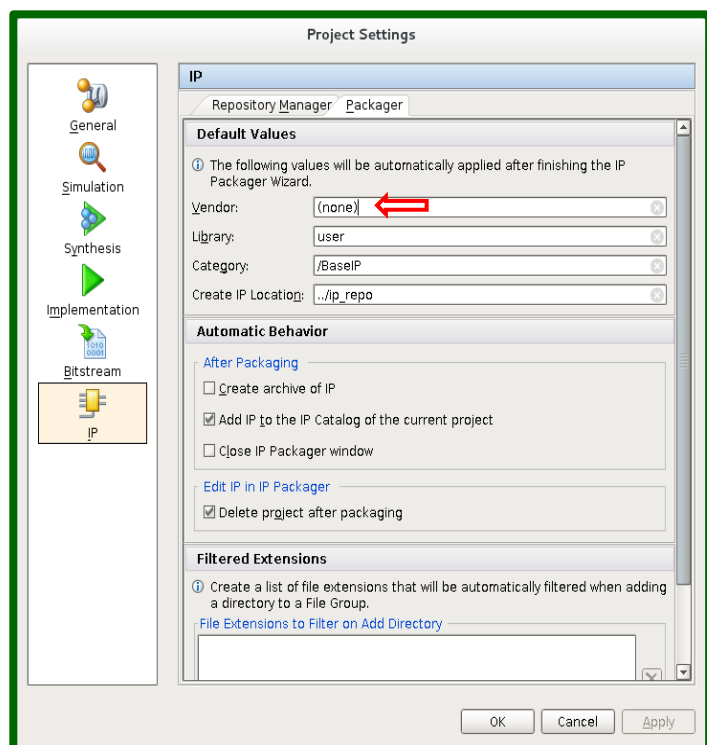

Figure 8. Unnamed vendor.

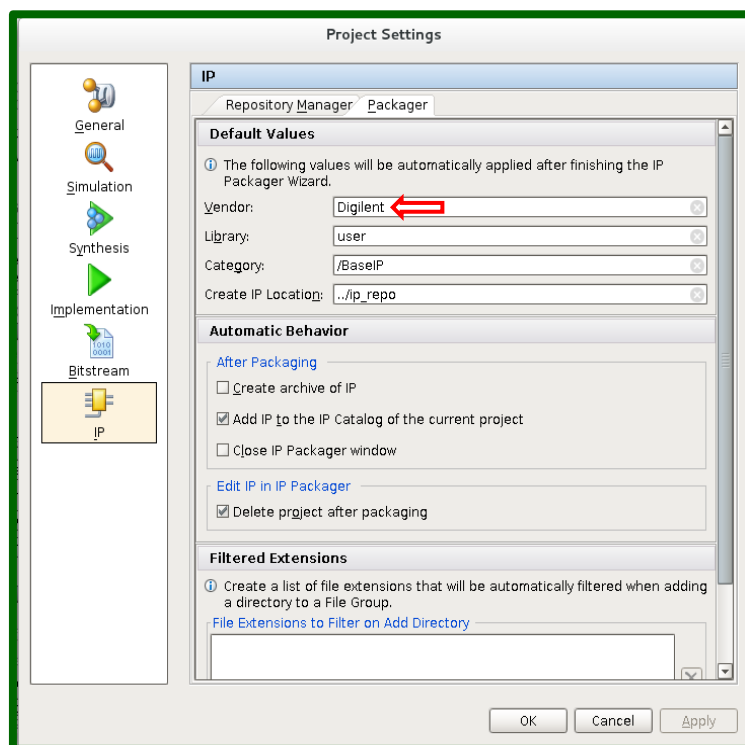

Figure 9. Named vendor.

- Now we can start implementing our myLed IP Core. Click **Tools -> Create and Package IP...** from the menu (as shown in Fig. 10). The Create and Package New IP window will pop up (as shown in Fig. 11), Click **Next**. In the next window, name the new IP and click next again (Fig. 12).

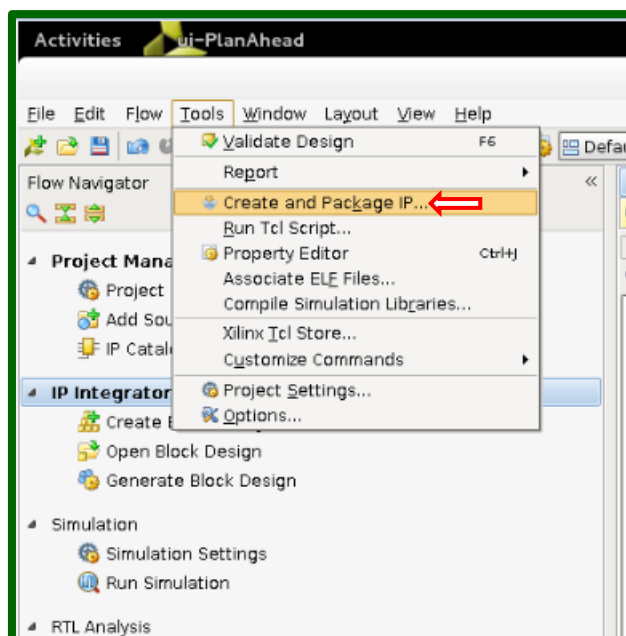

Figure 10. Create and Package IP.

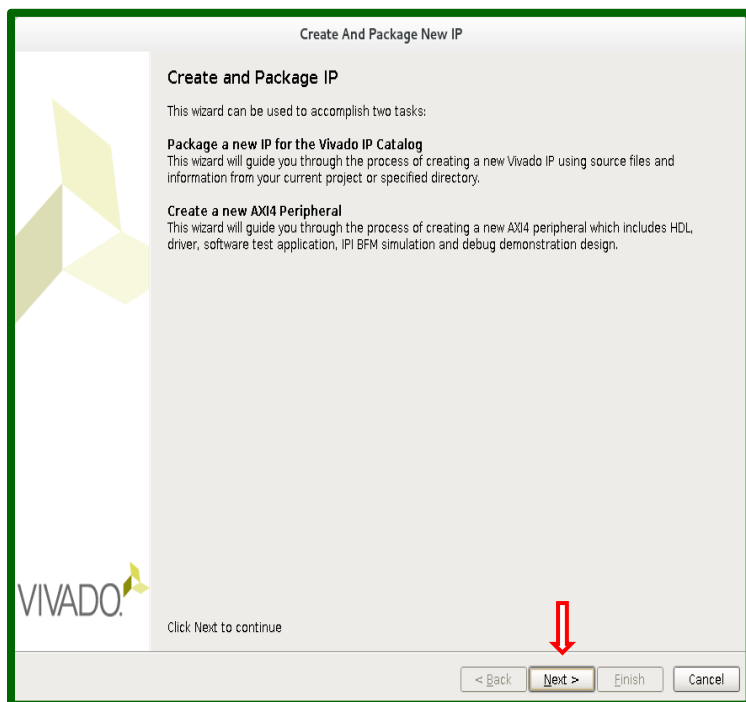

Figure 11. IP Options.

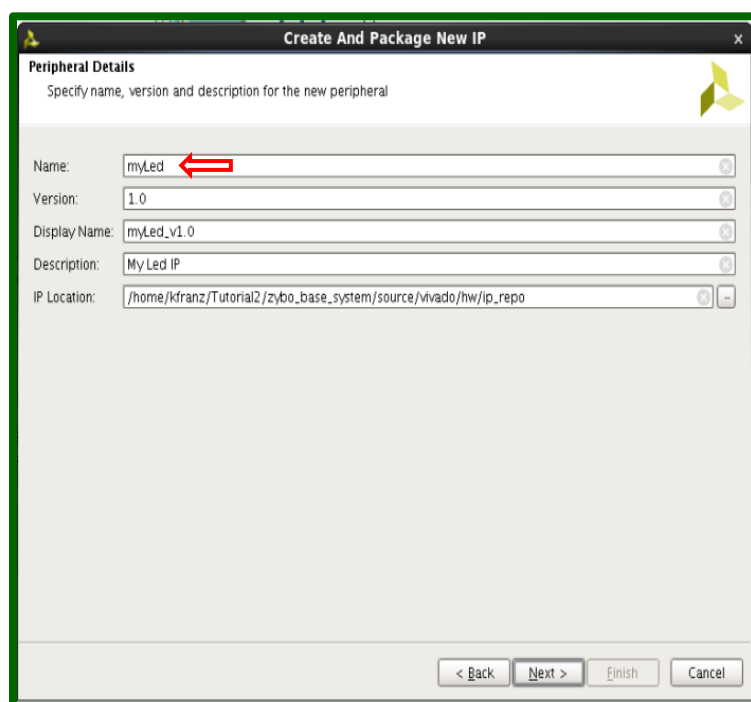

Figure 12. Peripheral Details.

- The next window will be the Add Interfaces Window. This will create the AXI4 Interface for the myLed peripheral (Fig. 13). Make sure the interface type is **Lite**, the mode is **Slave**, the data width is **32 bits** and the number of registers is **4**. Change the Name to **S_AXI** rather than S00_AXI. We only need 1 register but the minimum we can select is 4. Click next to proceed.

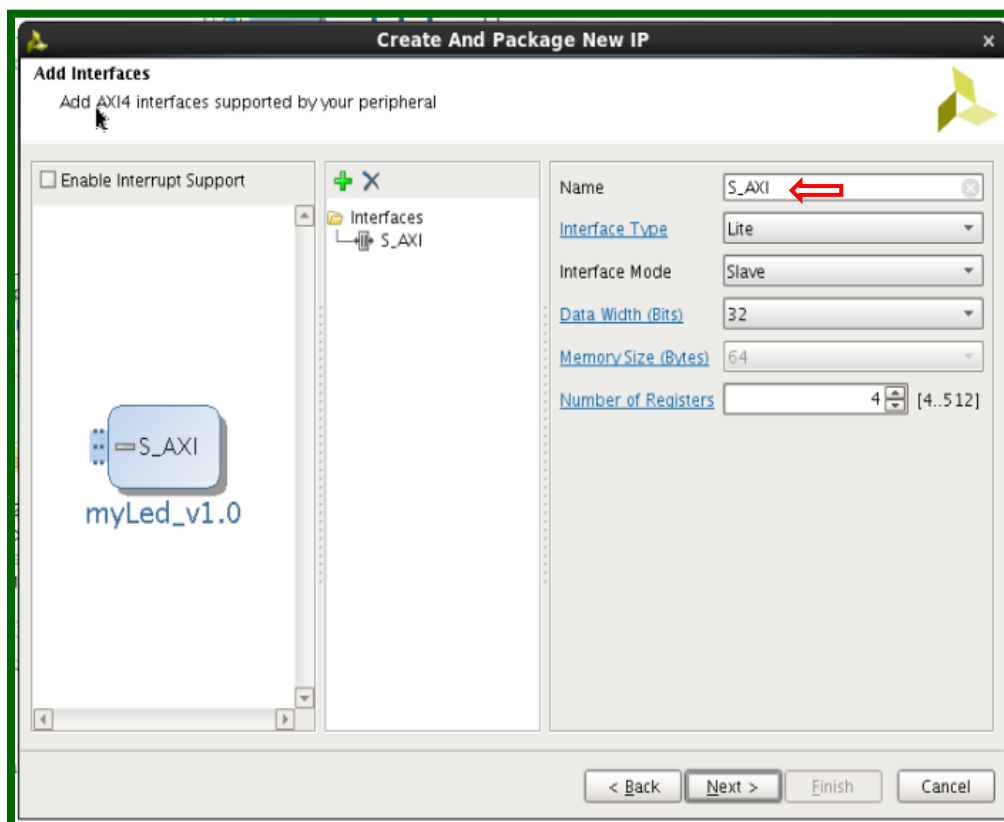

Figure 13. Add Interface

7. The next window will prompt the finishing steps to create the IP (Fig. 14). Change the Radio button to select **Edit IP** and hit finish. We need to add user logic to the IP so that our slave is connected to the LED output.

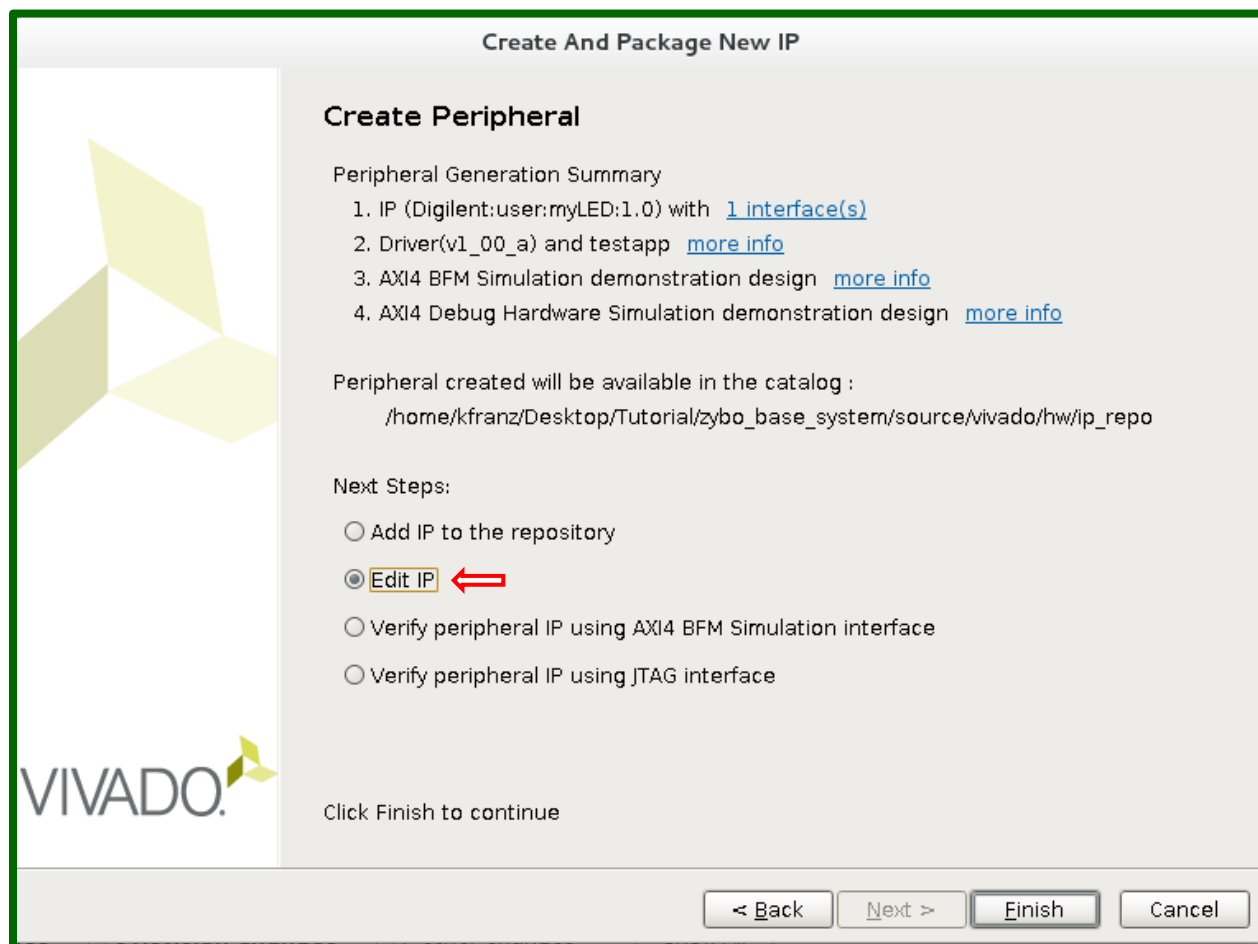

Figure 14. Edit IP.

8. After selecting finish, the Create and Package IP window will disappear and the next window you will see is the edit_myLed window (Fig. 15). This is where we will add our user logic.

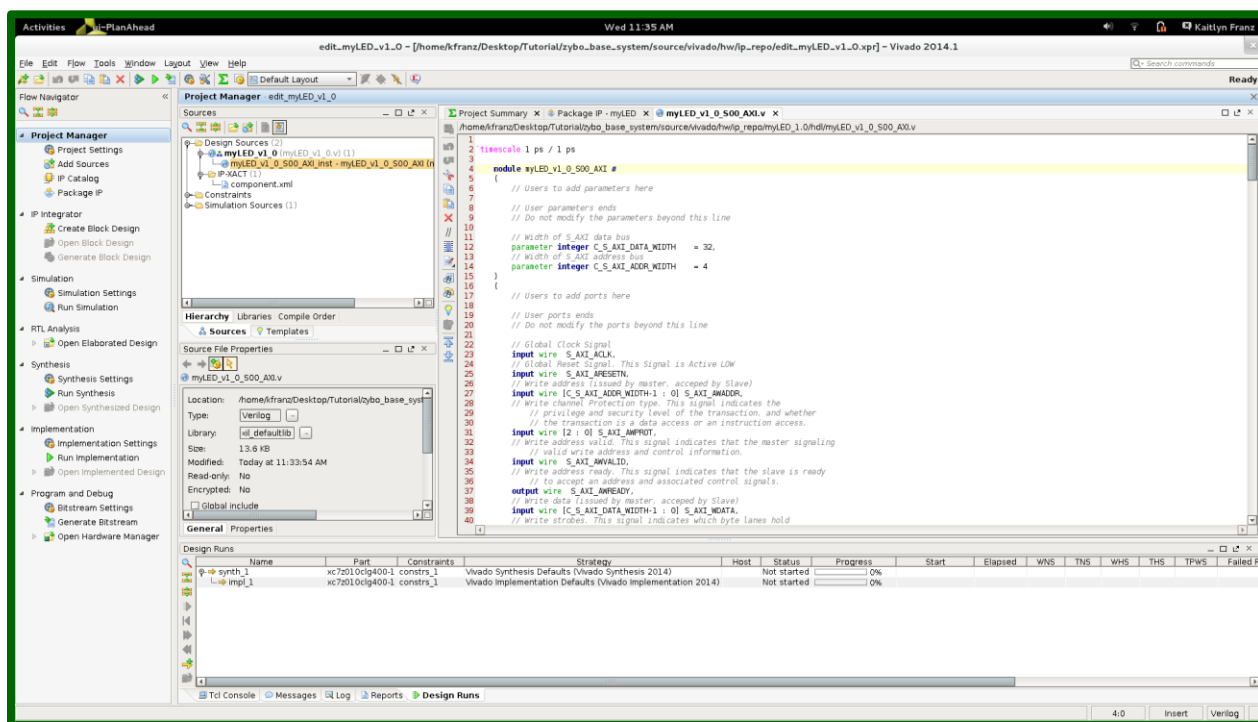

Figure 15. Edit_myLed.

- In the Project Manager, click the circle next to myLed_v1_0 and highlight **myLed_v1_0_S_AXI** (Fig. 16). This contains the user logic inside of the myLed IP. We need to add two lines of code to complete the user logic for this module. First, we need to create a user port called led (Fig. 17). Next, we need to connect the internal slave to this user port. We will connect slv_reg0[3:0] as we have four LEDs (Fig. 18).

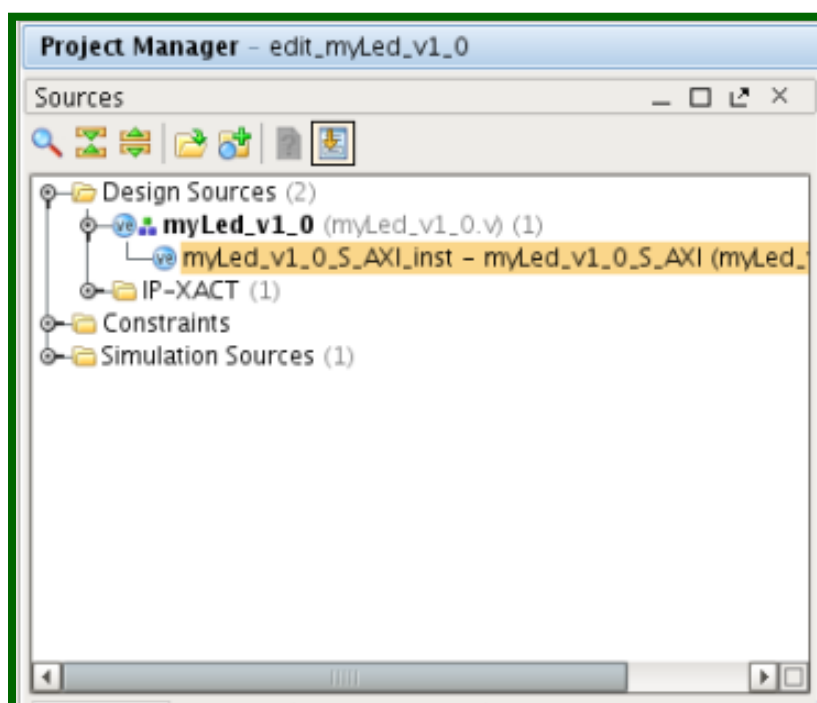

Figure 16. Select user logic file.

```

1  `timescale 1 ps / 1 ps
2
3
4  module myLed_v1_0_S00_AXI #
5  (
6      // Users to add parameters here
7
8      // User parameters ends
9      // Do not modify the parameters beyond this line
10
11     // Width of S_AXI data bus
12     parameter integer C_S_AXI_DATA_WIDTH  = 32,
13     // Width of S_AXI address bus
14     parameter integer C_S_AXI_ADDR_WIDTH  = 4
15 )
16 (
17     // Users to add ports here
18     output wire [3:0] led, ←
19     // User ports ends
20     // Do not modify the ports beyond this line
21

```

Figure 17. Add user port.

```

395     end
396     end
397     end
398
399     // Add user logic here
400     assign led = slv_reg0[3:0]; ←
401     // User logic ends
402
403 endmodule

```

Figure 18. Add user logic.

10. Next, we need to connect the user logic to myLed. In the project manager select the file **myLed_v_0**. To complete the IP, there are two lines of code we need to add to this file. Under the comment that says “Users to add ports here,” add a port for the LEDs (Fig. 19). Connect the led output from the previous file containing the user logic to myLed (Fig. 20).

```

2  `timescale 1 ps / 1 ps
3
4  module myLed_v1_0 #
5  (
6      // Users to add parameters here
7
8      // User parameters ends
9      // Do not modify the parameters beyond this line
10
11     // Parameters of Axi Slave Bus Interface S00_AXI
12     parameter integer C_S00_AXI_DATA_WIDTH  = 32,
13     parameter integer C_S00_AXI_ADDR_WIDTH  = 4
14 )
15 (
16     // Users to add ports here
17     output [3:0] led, ←
18     // User ports ends
19

```

Figure 19. Add External.

```

46 // Instantiation of Axi Bus Interface S00_AXI
47 myLed_v1_0_S00_AXI # (
48     .C_S_AXI_DATA_WIDTH(C_S00_AXI_DATA_WIDTH),
49     .C_S_AXI_ADDR_WIDTH(C_S00_AXI_ADDR_WIDTH)
50 ) myLed_v1_0_S00_AXI_inst (
51     .led(led), ←
52     .S_AXI_ACLK(s00_axi_aclk),
53     .S_AXI_ARESETN(s00_axi_aresetn),
54     .S_AXI_AWADDR(s00_axi_awaddr),
55     .S_AXI_AWPROT(s00_axi_awprot),
56     .S_AXI_AWVALID(s00_axi_awvalid),
57     .S_AXI_AWREADY(s00_axi_awready),
58     .S_AXI_WDATA(s00_axi_wdata),
59     .S_AXI_WSTRB(s00_axi_wstrb),
60     .S_AXI_WVALID(s00_axi_wvalid),

```

Figure 20. Connect myLed to User Logic.

11. Now that our IP is created and the user logic is defined, we need to package our IP. Under **Project Manager** on the left side of the window, select **Package IP**. A new tab will open that is called Package IP. On the left side of this tap there are a series of labels. We need to complete those that do not have green check marks.

First, select **IP customization Parameters**. At the top of that window select the option to **merge changes from IP Customization Parameters Wizard**, as in Fig. 21.

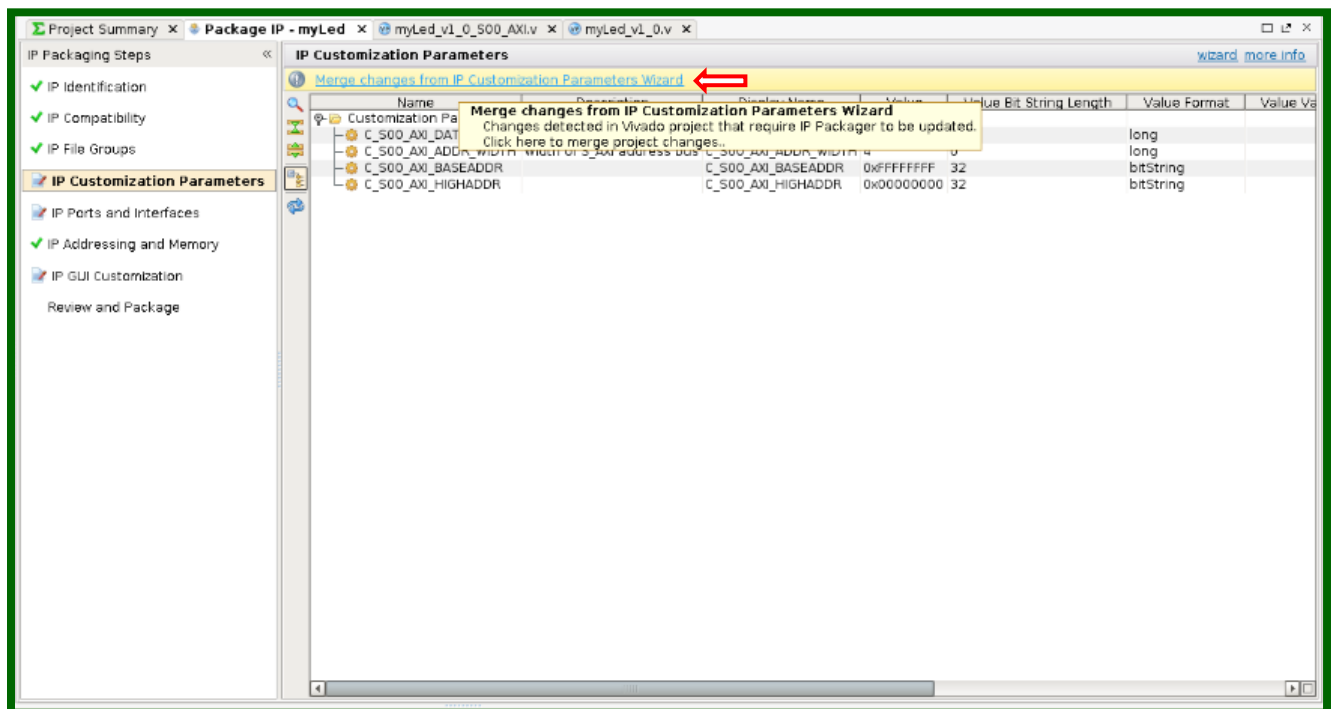

Figure 21. Customization Parameters.

Next, select the IP Ports and Interfaces. Notice that your new LED IP is there (Fig. 22).

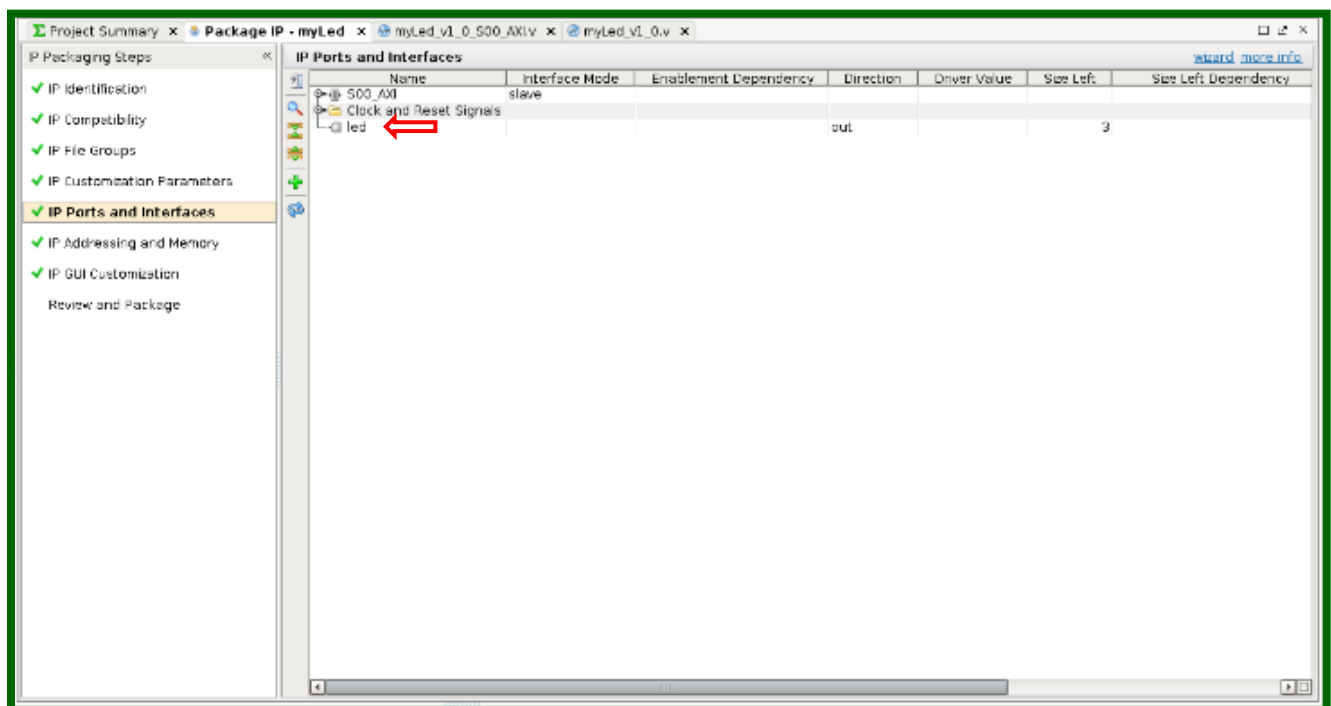

Figure 22. IP Ports and Interfaces.

Next, select **IP GUI Customization**. Our IP GUI is fine as is, so we won't make any changes here (Fig. 23).

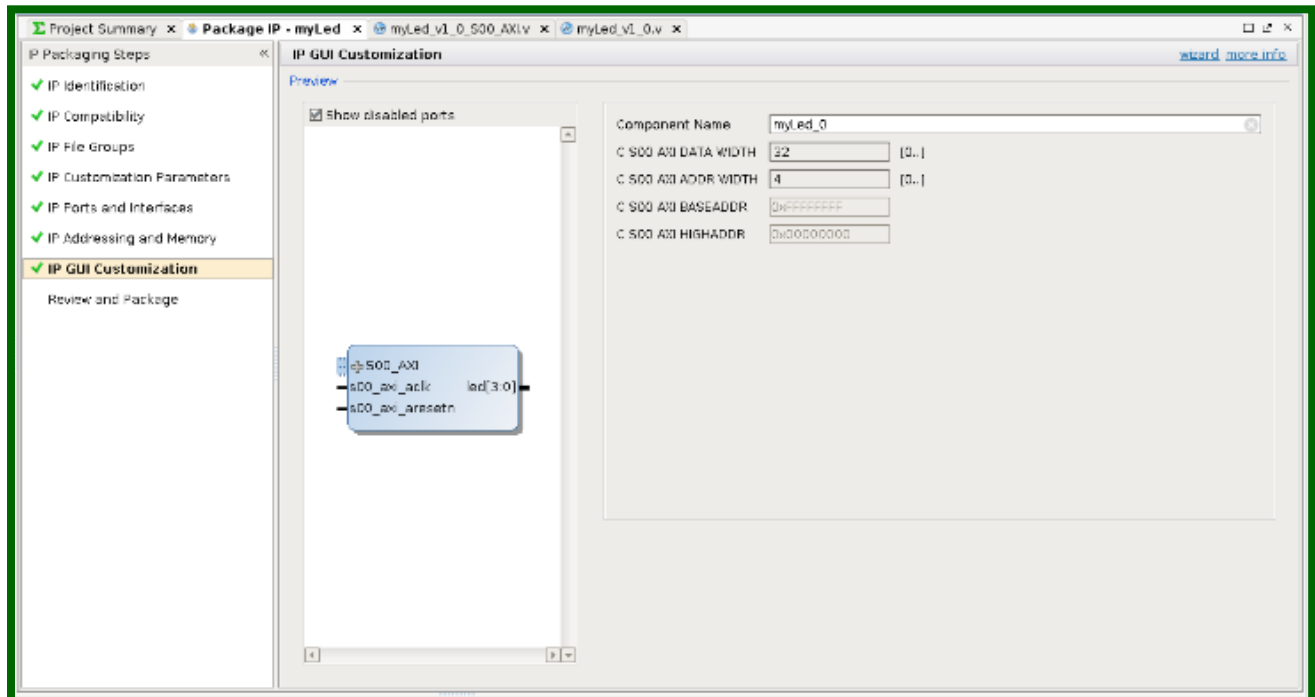

Figure 23. GUI Customization.

Now we can **Review and Package** our myLed IP. Select Review and Package IP and press the **Re-Package IP button**. Our IP is now completed and packaged.

12. We are going to add our IP to our design. Right click anywhere on the block design and click **Add IP** (as shown in Fig. 24). Select the correct IP, **myLed_v1.0**, and press enter (Fig. 23).

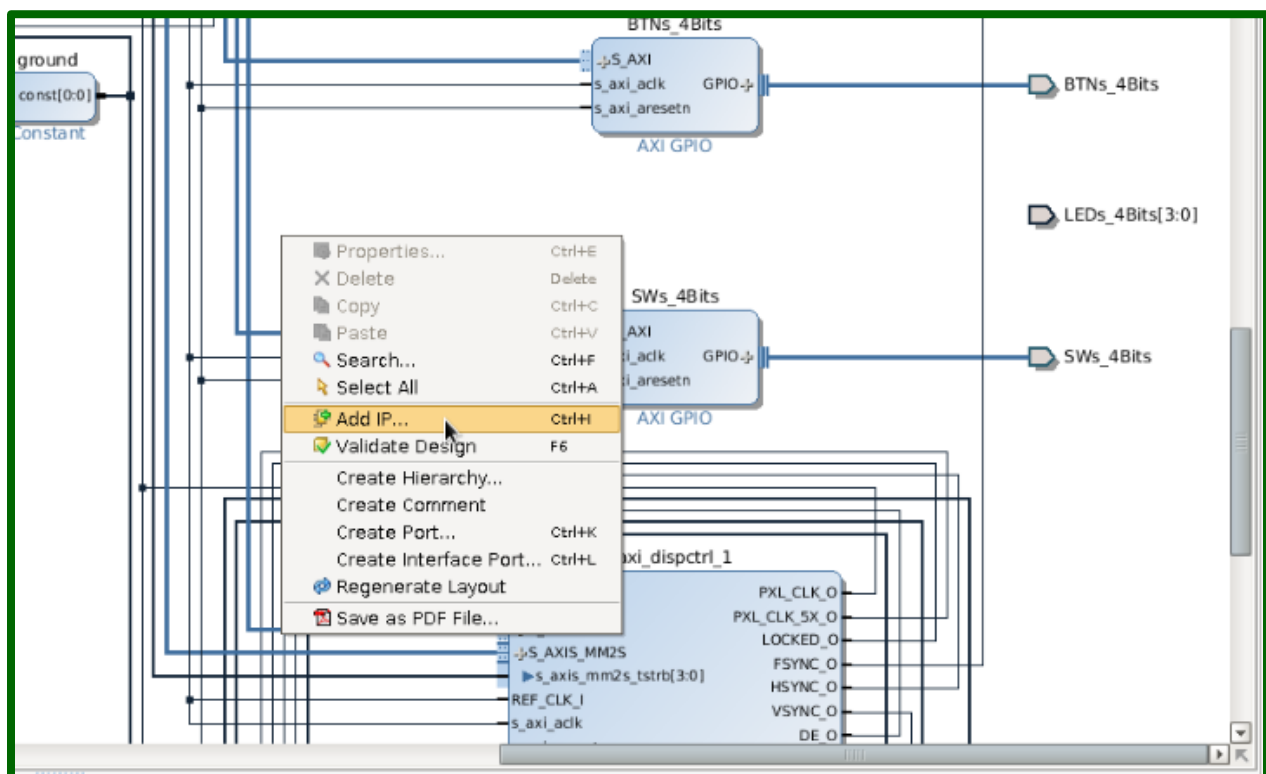

Figure 24. Add IP.

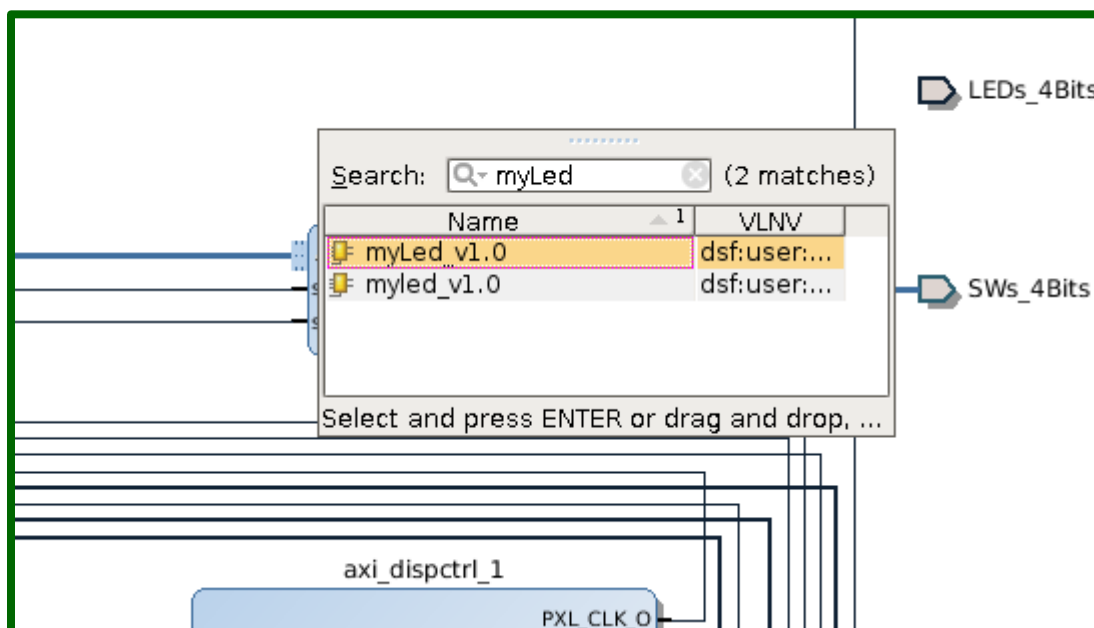

Figure 25. Select IP.

13. The AXI4-Lite bus of myLed IP Core needs to be connected to the processing system. At the top of the window, click the blue text that says **Run connection automation** (Fig. 26). This will connect the inputs of the myLed IP Core. You should see that S_AXI is now connected to the first output of the AXI Interconnect.

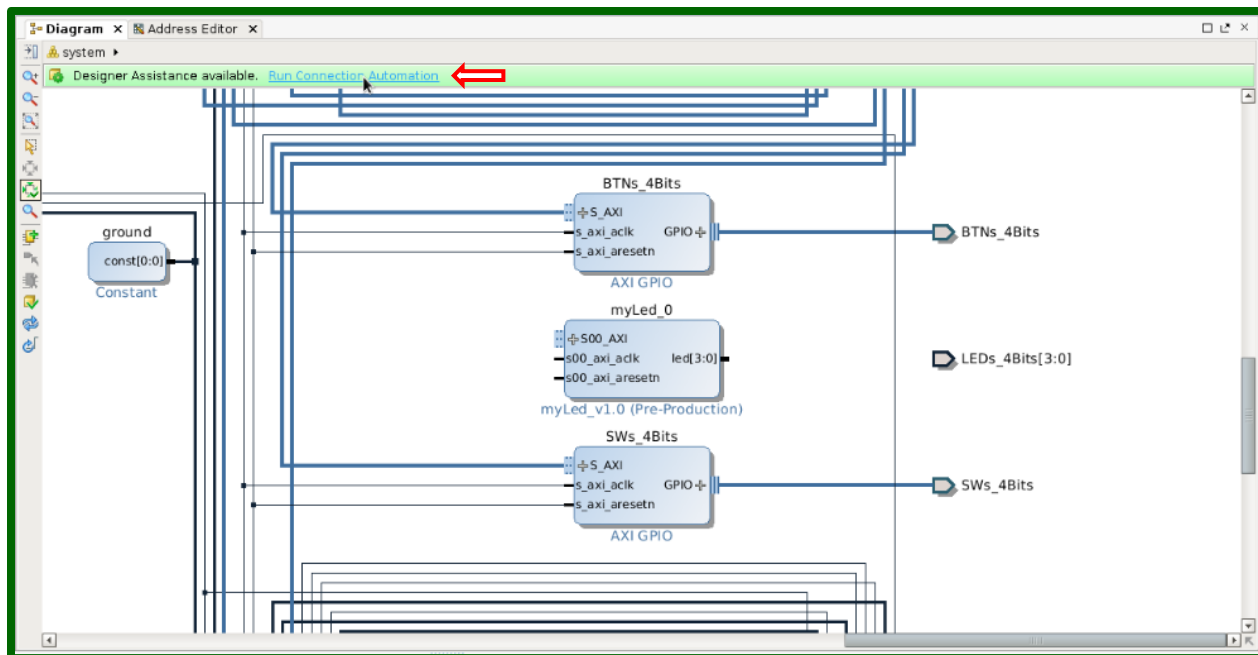

Figure 26. Connect IP.

14. Next, we need to connect the myLed IP to an external port. The myLed IP Core that we implemented will not connect to the existing LEDs_4Bits port, so we need to make a new external port called led. Click on the existing LED port and press delete. To create the new port, right click and select **create port** (Fig. 27). Name the port, select output, select vector [3:0] and press enter.

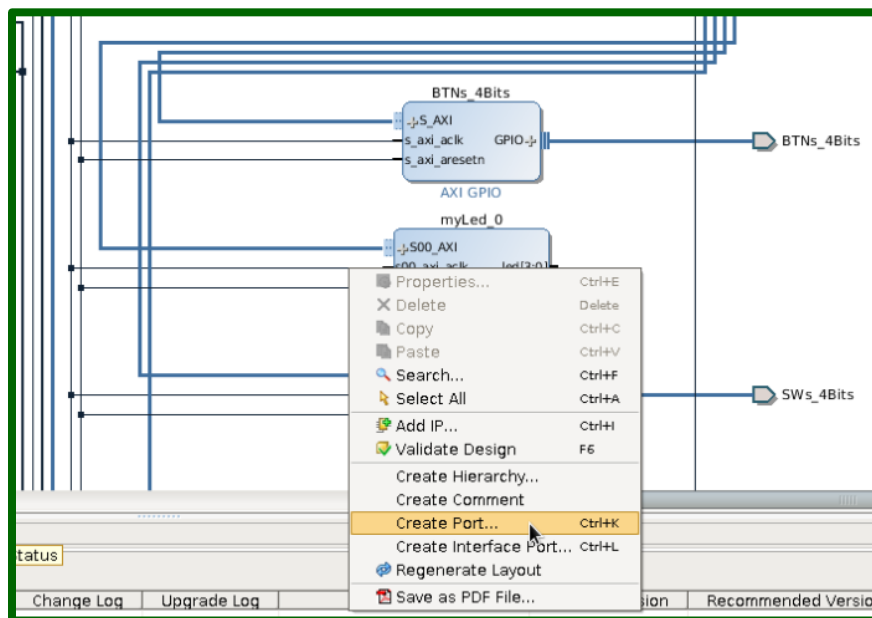

Figure 27. Create Port.

Next, connect the LED port to the myLed IP by clicking on the port and dragging a connection to myLed (Fig. 28).

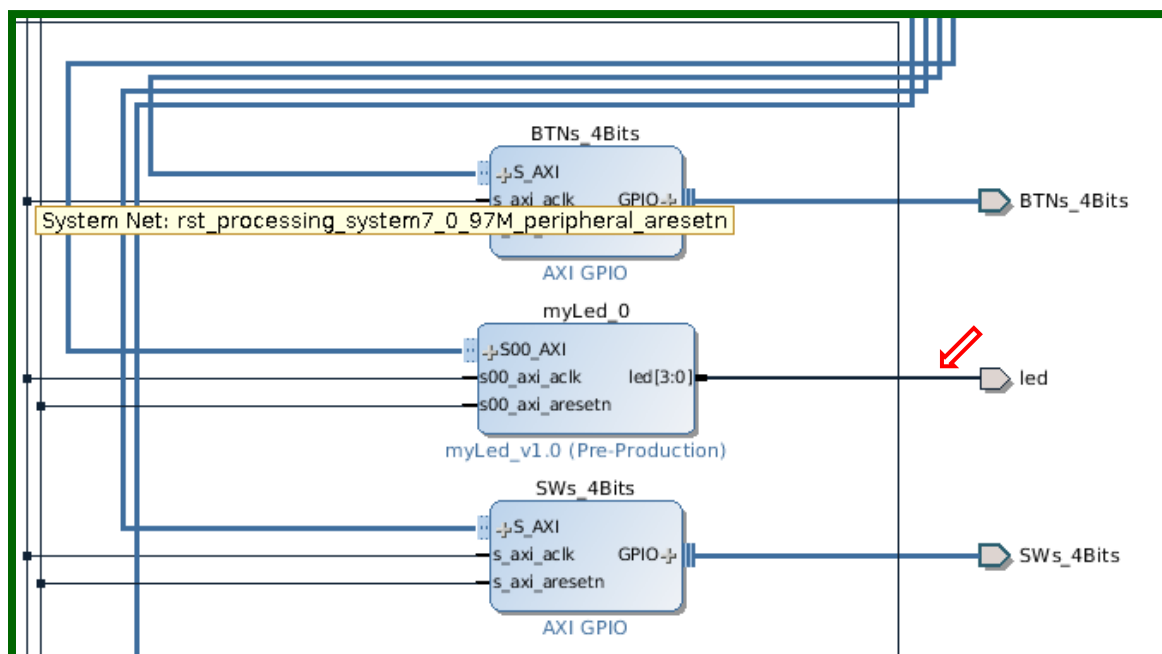

Figure 28. Connect IP to Port.

15. The final step is to specify the pin numbers for myled_0_LED_pin to physically connect our customized IP Core to the on-board LEDs. In the Project Manager, expand the Constraints section and select the **base.xdc** file (Fig. 29). Within that file, change the names of the external LED pins so that they match the name of our external led port (Fig. 30).

Figure 29. Open XDC File.

Figure 30. Connect Port led to the LEDs on the ZYBO Board.

16. Regenerate the bitstream for the hardware design by clicking on **Generate Bitstream** under Program and Debug on the left side of the window.

2 Compile U-Boot (Optional)

2.1 Prerequisites

- Vivado 2014.1 WebPACK: available at the Xilinx Website [Download Page](#).
- *ZYBO Base System Design*: available at the Digilent Website on the [ZYBO Page](#).

2.2 Instructions (Use the Master-Next Branch Until Further Notice)

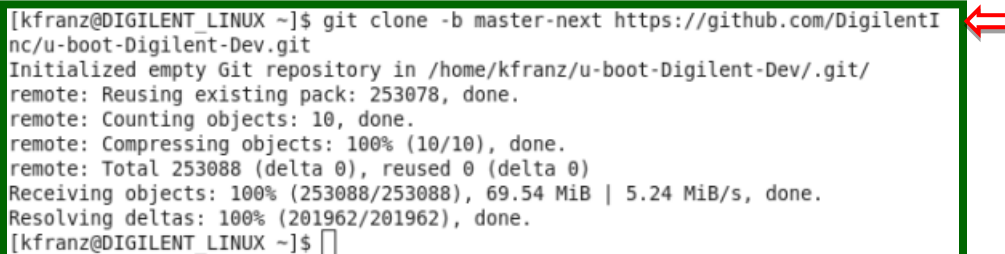

1. Get the source code for U-Boot from the Digilent Git repository. There are two ways to retrieve the source code:

Using *git* command: If you have Git installed in your distribution, you can clone the repository to your computer by command Git clone: <https://github.com/DigilentInc/u-boot-Digilent-Dev.git>. The whole Git Repository is around 55MB, as shown in Fig. 31. If you want to get a separate branch, follow Fig. 32. The next contains the U-boot that is not yet released. The clone URL referenced above can be found on the Digilent GitHub page, as seen in Fig. 33.

```
[kfranz@DIGILENT_LINUX ~]$ git clone https://github.com/DigilentInc/u-boot-Digilent-Dev.git
Initialized empty Git repository in /home/kfranz/u-boot-Digilent-Dev/.git/
remote: Reusing existing pack: 253078, done.
remote: Counting objects: 10, done.
remote: Compressing objects: 100% (10/10), done.
remote: Total 253088 (delta 0), reused 0 (delta 0)
Receiving objects: 100% (253088/253088), 69.54 MiB | 4.88 MiB/s, done.
Resolving deltas: 100% (201962/201962), done.
```

Figure 31. U-Boot repository.

```
[kfranz@DIGILENT_LINUX ~]$ git clone -b master-next https://github.com/DigilentInc/u-boot-Digilent-Dev.git
Initialized empty Git repository in /home/kfranz/u-boot-Digilent-Dev/.git/
remote: Reusing existing pack: 253078, done.
remote: Counting objects: 10, done.
remote: Compressing objects: 100% (10/10), done.
remote: Total 253088 (delta 0), reused 0 (delta 0)
Receiving objects: 100% (253088/253088), 69.54 MiB | 5.24 MiB/s, done.
Resolving deltas: 100% (201962/201962), done.
[kfranz@DIGILENT_LINUX ~]$
```

Figure 32. Next-repository.

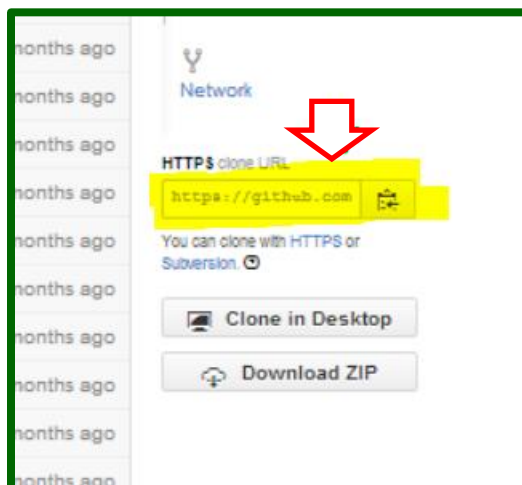

Figure 33. Clone URL.

- To compile U-Boot, we need cross-compile tools which are provided by Vivado 2014.1. Those tools have a prefix `arm-xilinx-linux-gnueabi-` to the standard names for the **GCC** tool chain. The prefix references the platforms that are used. The ZYBO board has two arm cores, so we reference arm. In order to use the cross-platform compilers, please make sure the Vivado 2014.1 settings have been sourced. If not, please refer to step 1 above. To configure and build U-Boot for ZYBO, follow Fig. 34.

```
[kfranz@DIGILENT_LINUX u-boot-Digilent-Dev]$ make CROSS_COMPILE=arm-xilinx-linux-gnueabi-
zynq_zybo_config
Configuring for zynq_ZYBO board...
[kfranz@DIGILENT_LINUX u-boot-Digilent-Dev]$ make CROSS_COMPILE=arm-xilinx-linux-gnueabi-
Generating include/autoconf.mk
Generating include/autoconf.mk.dep
...
arm-xilinx-linux-gnueabi-ld -gc-sections -Ttext 0x1000000 -o demo crt0.o demo.o libgenwrap.o
lent-Dev/arch/arm/lib/eabi_compat.o -L /opt/Xilinx/SDK/2014.1/gnu/arm/lin/bin/./lib/gcc/arm
arm-xilinx-linux-gnueabi-objcopy -O binary demo demo.bin 2>/dev/null
make[1]: Leaving directory /home/kfranz/Tutorial/u-boot-Digilent-Dev/examples/api'
[kfranz@DIGILENT_LINUX u-boot-Digilent-Dev]$
```

Figure 34. Compile U-Boot.

- After the compilation, the **ELF** (Executable and Linkable File) generated is named `u-boot`. We need to add a `.elf` extension to the file name so that Xilinx SDK can read the file layout and generate `BOOT.BIN`. In this tutorial, we are going to move the `u-boot.elf` to the `sd_image` folder and substitute the `u-boot.elf` that comes along with the *ZYBO Base System Design Package*, as shown in Fig. 35.

```
[kfranz@DIGILENT_LINUX u-boot-Digilent-Dev]$ cp u-boot ../zybo_base_system/sd_image/u-boot.elf
[kfranz@DIGILENT_LINUX u-boot-Digilent-Dev]$
```

Figure 35. Add .elf.

3 Generate BOOT.BIN

3.1 Prerequisites

- Vivado 2014.1 WebPACK: available at the Xilinx Website [Download Page](#).
- *ZYBO Base System Design*: available at the Digilent Website on the [ZYBO Page](#).
- Finished the hardware customization from [Section 1](#) and `u-boot.elf` from [Section 2](#) (Section 2 optional).

3.2 Instructions

1. Export the hardware design (after Section 1, step 16) to Xilinx SDK by clicking on **File -> Export -> Export Hardware for SDK...**, as shown in Fig. 36.

Figure 36. Export Hardware Design to SDK.

2. Leave the workspace as **<Local to Project>**. Make sure that the “Launch SDK” box is checked and click **OK**, as shown in Fig. 37.

Note: If you are using Vivado 2014.1, you may have to export twice.

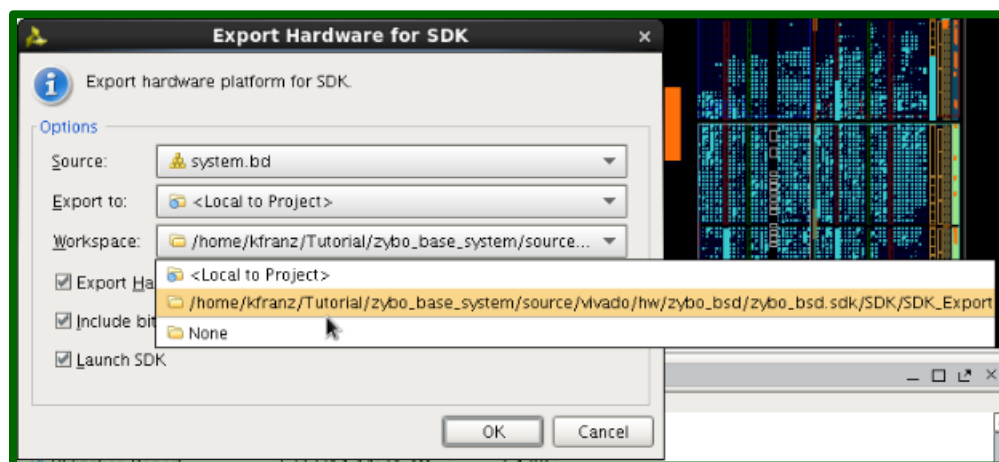

Figure 37. Set SDK Workspace Path.

- After SDK launches, the hardware platform project is already present in Project Explorer on the left of the SDK main window, as shown in Fig. 38. We now need to create a First Stage Bootloader (FSBL). Click **File->New->Project...**, as shown in Fig. 39.

Figure 38. Export hardware design to SDK.

Figure 39. Create new project in SDK.

4. In the New Project window, select **Xilinx->Application Project**, and then Click **Next** (Fig. 40).

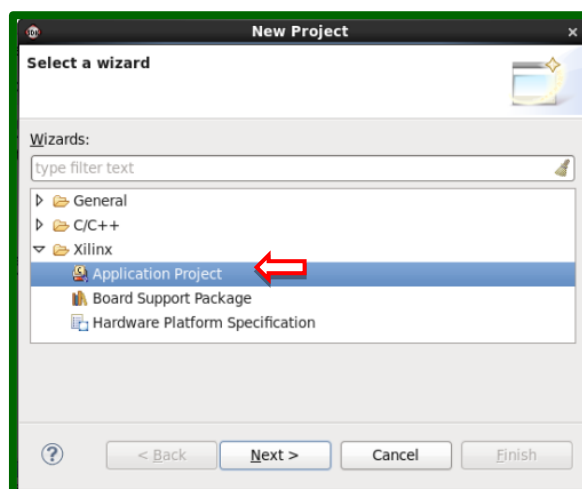

Figure 40. Select Application Project Wizard.

5. We will name the project FSBL. Select **hw_platform_0** for **Target Hardware** because it is the hardware project we just exported. Select **standalone** for **OS Platform**. Click **Next**, as shown in Fig. 41.

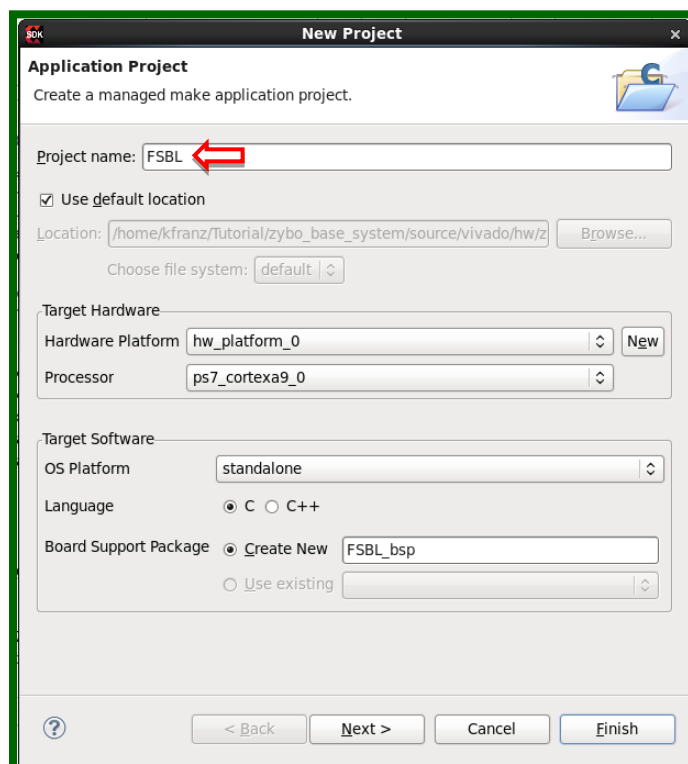

Figure 41. New Application Project.

6. Select **Zynq FSBL** as template, and click Finish as shown in Fig. 42.

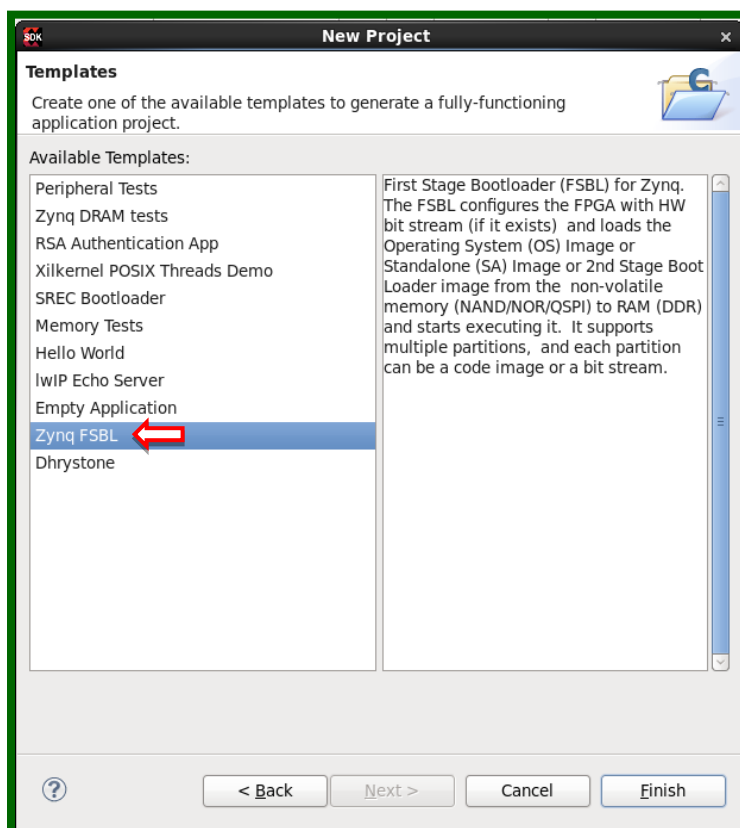

Figure 42. Select Zynq FSBL as template.

- For the ZYBO, we need to set the mac address for the Ethernet in the fsbl hook. We want the mac address for the Ethernet to remain constant when we turn the ZYBO board off and on. You can swap the fsbl_hooks.c file in the FSBL project with the fsbl_hooks.c under source/vivado/SDK/fsbl in the ZYBO Base System Design (Fig. 43).

Figure 43. fsbl_hooks.c

- After you have saved the changes to fsbl_hooks.c, the project will rebuild itself automatically. If it does not rebuild, click **Project->Clean** to clean the project files, and **Project->Build All** to rebuild all the projects. The compiled ELF file is located in:

ZYBO_base_system/source/vivado/hw/ZYBO_bsd.sdk/SDK/SDK_Export/FSBL/Debug

- Now we have all of the files ready to create BOOT.BIN. Click **Xilinx Tools -> Create Zynq Boot Image**, as shown in Fig. 44.

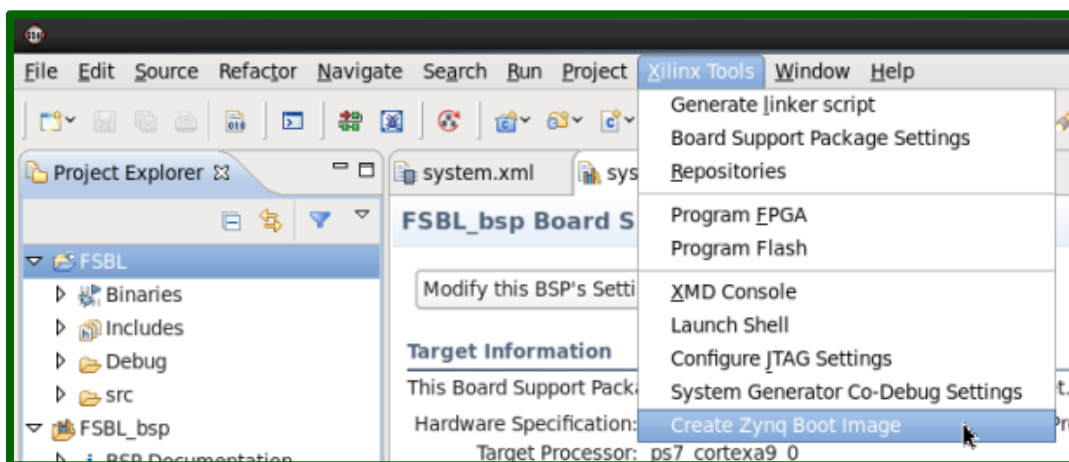

Figure 44. Create Zynq Boot Image.

10. In the Create Zynq Boot Image window (as shown in Fig. 45), Click **Browse** to set the path for **FSBL elf**. Click **Add** to add the `system.bit` file found at:
`/ZYBO_base_system/source/vivado/hw/ZYBO_bsd/ZYBO_bsd.sdk/SDK/SDK_Export/hw_platform_0/`. Click **Add** to add the `u-boot.elf` file found at:
`ZYBO_base_system/sd_image/`. It is very important that the 3 files are added in this order, or else the FSBL will not work properly (the proper order can be seen in Fig. 45). It is also very important that you set `FSBL.elf` as the bootloader and `system.bit` and `u-boot.elf` as data files. In this tutorial, the `sd_image` folder is set as output folder for the BIN file. Click **Create Image**.

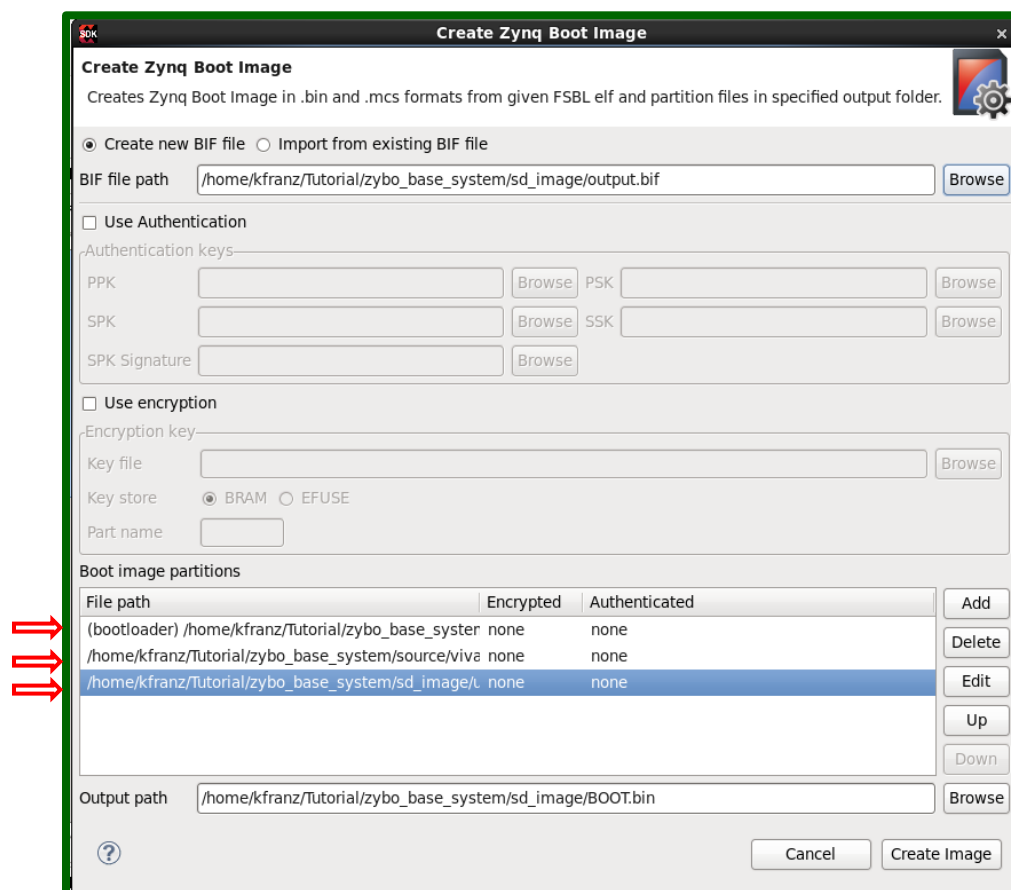

Figure 45. Create Zynq Boot Image Configuration.

11. The created BIN file was named BOOT.bin.

4 Compile Linux Kernel

4.1 Prerequisites

- Vivado 2014.1 WebPACK: available at the Xilinx Website [Download Page](#).
- *ZYBO Base System Design*: available at the Diligent Website on the [ZYBO Page](#).

4.2 Instructions (Use the Master-Next Branch Until Further Notice)

1. Get the Linux kernel source code from Diligent Git repository. There are two ways to retrieve the source code:

Using git command: If you have Git installed in your distribution, you can clone the repository to your computer by command `git clone https://github.com/DiligentInc/Linux-Diligent-Dev.git`
 The whole Git Repository is around 850MB, as shown in Fig. 46.

```
[kfranz@DIGILENT_LINUX ~]$ git clone https://github.com/DiligentInc/Linux-Digile
nt-Dev.git
Initialized empty Git repository in /home/kfranz/Linux-Diligent-Dev/.git/
remote: Counting objects: 3586185, done.
remote: Compressing objects: 100% (549192/549192), done.
remote: Total 3586185 (delta 3007223), reused 3586185 (delta 3007223)
Receiving objects: 100% (3586185/3586185), 864.81 MiB | 2.76 MiB/s, done.
Resolving deltas: 100% (3007223/3007223), done.
[kfranz@DIGILENT_LINUX ~]$
```

Figure 46. Clone Kernel.

2. We will start to configure the kernel with the default configuration for ZYBO. The configuration is located at `arch/arm/configs/xilinx_zynq_defconfig`. To use the default configuration, you can follow Fig. 47.

```
[kfranz@DIGILENT_LINUX Linux-Diligent-Dev]$ make ARCH=arm CROSS_COMPILE=arm-xilinx-linux-gnueabi- xilinx_zynq_defconfig
#
# configuration written to .config
#
[kfranz@DIGILENT_LINUX Linux-Diligent-Dev]$
```

Figure 47. Default Configuration.

3. Follow Fig. 48 to compile the Linux Kernel.

```
[kfranz@DIGILENT_LINUX Linux-Diligent-Dev]$ make ARCH=arm CROSS_COMPILE=arm-xilinx-linux-gnueabi-
scripts/kconfig/conf --silentoldconfig Kconfig
CHK include/config/kernel.release
CHK include/generated/uapi/linux/version.h
CHK include/generated/utsrelease.h
```

```
Kernel: arch/arm/boot/Image is ready
LD      arch/arm/boot/compressed/vmlinux
OBJCOPY arch/arm/boot/zImage
Kernel: arch/arm/boot/zImage is ready
Building modules, stage 2.
MODPOST 23 modules
[kfranz@DIGILENT_LINUX Linux-Digilent-Dev]$
```

Figure 48. Compile Kernel.

- After the compilation, the kernel image is located at arch/arm/boot/zImage. However, in this case the kernel image has to be a ulmage (unzipped) rather than a zimage. To make the uimage, follow Fig. 49.

```
[kfranz@DIGILENT_LINUX Linux-Digilent-Dev]$ make ARCH=arm CROSS_COMPILE=arm-xilinx-linux-gnueabi- UIMAGE_LOADADDR=0x8000 uImage
CHK     include/config/kernel.release
CHK     include/generated/uapi/linux/version.h
CHK     include/generated/utsrelease.h
make[1]: 'include/generated/mach-types.h' is up to date.
```

```
Data Size: 3819232 Bytes = 3729.72 kB = 3.64 MB
Load Address: 00008000
Entry Point: 00008000
Image arch/arm/boot/uImage is ready
[kfranz@DIGILENT_LINUX Linux-Digilent-Dev]$
```

Figure 49. Create ulmage.

Note: Depending on your distribution of Linux, you may get an error regarding the path of the mkimage. If this is the case, you can change the path following Fig. 50.

```
[kfranz@DIGILENT_LINUX Tutorial]$ PATH=$PATH:/home/kfranz/Tutorial/u-boot-Digilent-Dev/tools/
[kfranz@DIGILENT_LINUX Tutorial]$ echo $PATH
```

Figure 50. Change Path.

5 Test Kernel Image with Pre-built File System

5.1 Prerequisites

- Vivado 2014.1 WebPACK: available at the Xilinx Website [Download Page](#).
- Linux Kernel Source Code: available at Diligent GitHub repository <https://github.com/DigilentInc/Linux-Digilent-Dev>. (Use the Master-Next Branch Until Further Notice)
- Pre-built File System Image: ramdisk Image is available in ZYBO Linux Reference Design.
- BOOT.BIN from **Section 3**, uimage from **Section 4**.

5.2 Instructions

- To boot the Linux operating system on the ZYBO, you need BOOT.BIN, a Linux kernel image (ulmage), a device tree blob (DTB file), and a file system. BOOT.BIN has been created in Section 3 and ulmage has been compiled in Section 4. We will now compile the DTB file. The default device tree source file is

located in the Linux Kernel source at arch/arm/boot/dts/zynq-ZYBO.dts.

RAMDISK: modify the device tree source file according to Fig. 51. For Zynq, only the ramdisk image has to be wrapped in a u-boot header in order for u-boot to boot with it. This is shown in Fig. 52.

```

48     chosen {
49         /* bootargs = "console=ttyPS0,115200 root=/dev/mmcblk0p2 rw earlyprintk
rootfstype=ext4 rootwait devtmpfs.mount=1"; */
50         bootargs = "console=ttyPS0,115200 root=/dev/ram rw initrd=0x800000,8M
init=/init earlyprintk rootwait devtmpfs.mount=1";

Image Type:   ARM Linux RAMDisk Image (gzip compressed)
Data Size:    3694108 Bytes = 3607.53 kB = 3.52 MB
Load Address: 00000000
Entry Point:  00000000
[kfranz@DIGILENT_LINUX Tutorial]$

```

Figure 52. Make Uramdisk Image.

2. Generate DTB file, as shown in Fig. 53.

```

[kfranz@DIGILENT_LINUX Linux-Digilent-Dev]$ ./scripts/dtc/dtc -I dts -O dtb -o .
./devicetree.dtb arch/arm/boot/dts/zynq-zybo.dts
[kfranz@DIGILENT_LINUX Linux-Digilent-Dev]$

```

Figure 53. Generate DTB File.

3. **(RAMDISK)** Copy BOOT.BIN, devicetree.dtb, ulmage and uramdisk.image.gz to the first partition of an SD card, as shown in Fig. 54.

```

[kfranz@DIGILENT_LINUX Tutorial]$ ls
devicetree.dtb  linux-digilent-dev  u-boot-digilent  ZYBO_base_system
[kfranz@DIGILENT_LINUX Tutorial]$ cp ZYBO_base_system/sd_image/BOOT.BIN /media/ZYBO_BOOT/
[kfranz@DIGILENT_LINUX Tutorial]$ cp ZYBO_base_system/sd_image/ uramdisk.image.gz /BOOT.BIN
/media/ZYBO_BOOT/
[kfranz@DIGILENT_LINUX Tutorial]$ cp ./devicetree.dtb /media/ZYBO_BOOT/
[kfranz@DIGILENT_LINUX Tutorial]$ cp Linux-Digilent-Dev/arch/arm/boot/uImage /media/ZYBO_BOOT/
[kfranz@DIGILENT_LINUX Tutorial]$

```

Figure 54. Ramdisk.

4. Plug the SD card into the ZYBO. To boot from the SD card, jumper 7 needs to be configured for USB, as shown on the ZYBO board, and Jumper 5 must be connected to SD. Connect UART port to PC with a micro USB cable and set the UART terminal on PC to 115200 baud rate, 8 data bits, 1 stop bit, no parity, and no flow control. After powering on the board, the console (shown in Fig. 55) should be seen at the UART terminal if you use RamDisk. More information about these file systems can be found in *Getting Started with Embedded Linux - ZYBO*.

6 Modify Device Tree and Compose Kernel Driver

6.1 Prerequisites

- Vivado 2014.1 WebPACK: available at the Xilinx Website [Download Page](#).
- Linux Kernel Source Code: available at Diligent GitHub repository <https://github.com/Digilentinc/Linux-Digilent-Dev> (Use the Master-Next Branch Until Further Notice)

6.2 Instructions

1. Create a directory named “drivers” in the Tutorial folder, as shown in Fig. 56. Inside the driver’s directory, we will compose the driver for the myLed controller.

```
[kfranz@DIGILENT_LINUX Tutorial]$ mkdir drivers
[kfranz@DIGILENT_LINUX Tutorial]$ ls
BOOT.bin          output.bif          vivado.jou
drivers            ps_clock_registers.log  vivado.log
Linux-Digilent-Dev u-boot-Digilent-Dev  zybo_base_system
[kfranz@DIGILENT_LINUX Tutorial]$ 
```

Figure 56. Driver Directory.

2. We need a Makefile so that we can compile the driver. The Makefile is created in Fig. 57.

```
[kfranz@DIGILENT_LINUX Tutorial]$ cd drivers
[kfranz@DIGILENT_LINUX drivers]$ vim Makefile
```

Figure 57. Create Makefile.

After creating the file, hit I to change to insert mode and insert the following text (Fig. 58).

```
obj-m := myled.o

                                all:
    make -C ../Linux-Digilent-Dev/ M=$(PWD) modules

clean:

    make -C ../Linux-Digilent-Dev/ M=$(PWD) clean
```

Figure 58. Makefile.

Note: make sure the spacing in the Makefile is made up of tabs, not spaces, where necessary. Then hit esc to exit insert mode and :x to save the file and exit vim editor.

3. We will start with a simple driver that creates a file named myled under the Linux /proc file system. The status of the on-board LEDs can be changed by writing a number to the file. The driver is coded in Fig. 59.

```
kfranz@DIGILENT LINUX drivers]$ vim myled.c
```

Figure 59. Create myled.c

```

1 #include <linux/kernel.h>
2 #include <linux/module.h>

Building modules, stage 2.
MODPOST 1 modules
CC /home/kfranz/Tutorial/drivers/myLed.mod.o
LD [M] /home/kfranz/Tutorial/drivers/myLed.ko
make[1]: Leaving directory `/home/kfranz/Tutorial/Linux-Digilent-Dev'
[kfranz@DIGILENT_LINUX drivers]$
```

Figure 61. Compile Driver.

5. We need to add the **myLed** device node into the device tree. Make a copy of the default device tree source in the drivers folder, and modify it according to Fig. 62. The compatibility string of the node is the same as we define in the driver source code (myled.c: line 182). The reg property defines the physical address and size of the node. The address here should match with the address of the myLed IP Core in the address editor tab of the Vivado design, as shown in Fig. 63.

```
[kfranz@DIGILENT_LINUX drivers]$ cp ../Linux-Digilent-Dev/arch/arm/boot/dts/zynq-ZYBO.dts ./
[kfranz@DIGILENT_LINUX drivers]$ vim zynq-ZYBO.dts
```

Figure 63. Edit device tree.

```

549         spi-speed-hz = <4000000>;
550         spi-sclk-gpio = <&ps7_gpio_0 59 0>;
551         spi-sdin-gpio = <&ps7_gpio_0 60 0>;
552     };
553
554     myled {
555         compatible = "dglnt,myled-1.00.a";
556         reg = <0x43c30000 0x10000>;
557     };
558 };
559 };

```

Figure 64. zynq-ZYBO.dts

6. Recompile the device tree blob as shown in Fig. 65.

```

[kfranz@DIGILENT_LINUX drivers]$ ../Linux-Digilent-Dev/scripts/dtc/dtc -I dts -O dtb -o
devicetree.dtb zynq-ZYBO.dts
DTC: dts->dtb on file "zynq-ZYBO.dts"
[kfranz@DIGILENT_LINUX drivers]$

```

Figure 65. Compile DTB.

7. Copy these two files to the first partition of the SD card, as shown in Fig. 66. We are ready to test our driver on-board now.

```

[kfranz@DIGILENT_LINUX drivers]$ ls
devicetree.dtb  Makefile      Module.symvers  myled.ko      myled.mod.o
zynq-ZYBO.dts  modules.order myled.c          myled.mod.c   myled.o
[kfranz@DIGILENT_LINUX drivers]$ cp myled.ko /media/ZYBO_BOOT/d
[kfranz@DIGILENT_LINUX drivers]$ cp devicetree.dtb /media/ZYBO_BOOT/
[kfranz@DIGILENT_LINUX drivers]$

```

Figure 66. Copy files to SD.

8. Plug the SD card into the ZYBO and we can start testing our driver. Use the **insmod** command to install the driver module into the kernel. After the driver is installed, an entry named **myled** will be created under the **/proc** file system. Writing **0x0F** to **/proc/myled** will light up **LED 0~3**. You can either remove the driver with command **rmmod** or power off the system by command **poweroff**. In both cases, all of the LEDs will be turned off, as shown in Fig. 67. For instructions on using the terminal with the ZYBO, please refer to **Section 5, Step 4** or the Section **Boot from SD** in *Getting Started with Embedded Linux – ZYBO*.

7 User Application

7.1 Prerequisites

- Vivado 2014.1 WebPACK: available at the Xilinx Website [Download Page](#).

7.2 Instructions

1. In this section, we will write a user application that makes the LEDs blink by writing to /proc/myled. Create a directory named **user_app** in the Tutorial folder, as shown in Fig. 68. Inside the **user_app** directory, we will compose the led_blink.c, as shown in Fig. 69.

```
[kfranz@DIGILENT_LINUX Tutorial]$ mkdir user_app
[kfranz@DIGILENT_LINUX Tutorial]$ ls
devicetree.dtb  drivers  linux-digilent  u-boot-digilent  user_app  ZYBO_base_system
[kfranz@DIGILENT_LINUX Tutorial]$
```

Figure 68. User_app

```
[kfranz@DIGILENT_LINUX user_app]$ vim led_blink.c
```

Figure 69. led_blink

```
0 #include <stdio.h>
1 #include <stdlib.h>
2 #include <unistd.h>
3
4 int main()
5 {
6     FILE* fp;
7     while(1) {
8         fp = fopen("/proc/myled", "w");
9         if(fp == NULL) {
10             printf("Cannot open /proc/myled for write\n");
11             return -1;
12         }
13         fputs("0x0F\n", fp);
14         fclose(fp);
15         sleep(1);
16         fp = fopen("/proc/myled", "w");
17         if(fp == NULL) {
18             printf("Cannot open /proc/myled for write\n");
19             return -1;
20         }
21         fputs("0x00\n", fp);
22         fclose(fp);
23         sleep(1);
24     }
25     return 0;
26 }
```

Figure 70. led_blink.c

2. Compose a Makefile and compile led_blink.c into led_blink.o, as shown in Figs. 71-73.

```
[kfranz@DIGILENT_LINUX user_app]$ vim Makefile
```

Figure 71. Makefile.

```
1 CC = arm-xilinx-linux-gnueabi-gcc
2 CFLAGS = -g
3
4 all : led_blink
5
6 led_blink : led_blink.o
7     ${CC} ${CFLAGS} $^ -o $@
8
9 clean :
10     rm -rfv *.o
11     rm -rfv led_blink
12
13 .PHONY : clean
```

Figure 72. Makefile.

```
[kfranz@DIGILENT_LINUX user_app]$ make
arm-xilinx-linux-gnueabi-gcc -g -c -o led_blink.o led_blink.c
arm-xilinx-linux-gnueabi-gcc -g -o led_blink led_blink.o
[kfranz@DIGILENT_LINUX user_app]$ ls
led_blink led_blink.c led_blink.o Makefile
[kfranz@DIGILENT_LINUX user_app]$
```

Figure 73. Compile led_blink.

3. Insert the SD card into the computer, and copy the binary file `led_blink` onto the first partition of SD card, as shown in Fig. 74.

```
[kfranz@DIGILENT_LINUX user_app]$ cp led_blink /media/ZYBO_BOOT/
```

Figure 74. Move led_blink.

```
...
rcS Complete
zynq> mount /dev/mmcblk0p1 /mnt/
zynq> cd /mnt/
zynq> ls
BOOT.BIN          devicetree.dtb    led_blink
myled.ko          ramdisk8M.image.gz zImage
zynq> insmod myled.ko
[ 122.160000] myled probed at va 0x8000
zynq> ./led_blink
^C
zynq> mkdir -p /lib/modules/`uname -r`
zynq> cp myled.ko /lib/modules/`uname -r`
zynq> rmmmod myled
```
